# Investigation for Carrying Incomplete Pairwise Comparisons in AHP 

Takao Ohya<br>School of Science and Engineering, Kokushikan University, 4-28-1 Setagaya, Setagaya-ku, Tokyo 154-8515, Japan.<br>Takaohya@kokushikan.ac.jp

Keywords: incomplete pairwise comparisons, Harker method, logarithmic least square method
Summary: This paper report results of numerical experimental comparisons with random number for carrying out incomplete pairwise comparisons. In this report, Harker method (HM) and Logarithmic least square method (LLSM) are compared. Several methods of selecting comparing pairs are used for numerical experiments

## 1. Introduction

The number of pairwise comparisons necessary in AHP is square order of the number of the alternatives. So the great number of pairwise comparisons is necessary when there are many numbers of alternatives. This paper report results of numerical experimental comparisons with random number for carrying out incomplete pairwise comparisons.

## 2. Algorithms

Several algorithms for calculation from incomplete comparisons have been proposed. Among them, Harker method (HM) and Logarithmic least square method (LLSM) are compared .

## 3. Selecting Methods

Followings methods of selecting comparing pairs are used for numerical experiments.:

- Front and back m alternatives,
- Hierarchical selected by order of numbers
- Hierarchical selected by order of value.

## 3. Numerical experiments

From numerical experiments with random numbers, following results are gained.

- LLSM is slightly superior to HM.
- In the examined methods of selecting comparing pairs, hierarchical selected by order of value is the best.
- Difference which algorithm is used for calculation is smaller than difference which method of selecting comparing pairs is used.

Table 1. Correlation coefficient between incomplete pairwise comparison and complete pairwise comparison ( $\mathrm{S}=1.3$ )

| Selecting method | algorithm | 15 alternatives | 20 alternatives | 25 alternatives | 30 alternatives |
| :---: | :---: | :---: | :---: | :---: | :---: |
